

ABSTRACT OF THE DISCLOSURE

The invention focuses on method and apparatus for simply attaching various building elements to a surface (which may be finished) in a manner where the connection is preferably substantially hidden after attachment. Applications include the erection of
5 enclosures and partitions in bathrooms, showers and wet areas. As many of the members are hollow and route services, preferred embodiments allow for the passage of, and/or connection to, services such as plumbing from within the surface to which the element is attached and to within the member itself. Certain methods and apparatuses comprise
10 interacting cam and engaging portions allowing the element to be attached to the cam portion, once it has been secured in place, in a simple action, such as that typical of bayonet type connections.
